***The Canadian Iron and Steel Energy  
Research Association (CISERA) was formed  
on September 2, 1965 – providing over 60  
years of Research supporting the Canadian  
Coal and Carbonization Industries***

---

---

## CHAIR'S REMARKS

In order to encompass, emphasize and promote the additional areas of research the association has been focusing on, the name of the CCRA (Canadian Iron and Steel Energy Research Association) has been updated. In an effort to better reflect the work we are now conducting in order to meet the Canadian 2050 GHG targets we agreed that a more suitable name would be the Canadian Iron and Steel Energy Research Association (CISERA). This does not change the history of this rich and valuable association but better reflects the new goals that are needed to meet our members needs of the future.

Since its inception in 1965, the Canadian Iron and Steel Energy Research Association (CISERA) has provided a valuable framework for technical cooperation between government and industry, which has been very successful for all parties. CISERA is a unique organization in the fact that it is Canada's only technical support for the Canadian metallurgical coal and coking industries. This organization continues to be of extreme value to its member companies and to the financial health of the associated industries as we transition to a net-zero world. The value of its research continues to be recognized and appreciated on an international basis.

The key role of CISERA is to strive to meet its members' technological needs in an ever-changing world. Its research program continues to evolve as the demands of the coal, cokemaking and ironmaking industries change with the environmental pressures facing Canada and the world. GHG reduction in heavy industries including steel, cement and limestone are major area of focus. It was announced in 2021 that two of the three integrated steel companies in Canada are targeting >60% GHG reductions with the transformation from the traditional cokemaking, ironmaking and BOF steelmaking process to EAF technology by 2030. These EAF's will be fed by either direct reduced iron or scrap. Meeting GHG reduction targets for the remaining steel production in Canada via the traditional blast furnace route which will be in operation for years to come will have its own unique challenges. In all cases, biocarbon use, carbon capture and either sequestration or utilization will require further R&D initiatives.

Overall, CISERA will continue to be visionaries during this transformational change period and will help industry prepare for the future. The Canadian Steel Producers Association (CSPA) has recognized the CISERA as a technical leader in research and implementation of solutions and is now their technical branch for their members going forward. CISERA has a long history and successful collaboration with CanmetENERGY-Ottawa in technology development. This collaboration will continue and has been extended to include other Canmet Laboratories including NRCan (CanmetENERGY-Ottawa, CanmetENERGY-Varenes and CanmetMATERIALS-Hamilton) to work with their experts on the broader scope of technology transformation and implementation for coal producers, steel producers, and other heavy industries. There are numerous scientific experts working at CanmetENERGY on decarbonization and these resources will be relied upon to further advance the CISERA R&D program.

The CISERA program continues to be updated to meet the current needs of its members as well as future challenges. It must be noted that the CISERA will continue to support the very important coal and cokemaking sector in Canada. However, CISERA has also recognized that the R&D program must also include GHG reduction initiatives for its members and other heavy industries. This aligns with Federal Government policy and direction.

---

The Net Zero Emission Process Development program continues to be a key area of focus for our research, as well as Blast Furnace process enhancement. Areas of focus for CISERA research includes:

Blast furnace process enhancement

- Fundamentals of coal science
- Blast furnace carbon efficient enhancement

Net Zero Emission Process Development

- Supply of Alternate Reductants and Alternative Fuels
- Utilization of Alternative Reductants (Biocarbon, H<sub>2</sub>, Electrons)
- Utilization of Alternate Heating (Renewable Fuels and Non-Emitting Electricity)
- CO<sub>2</sub> Capture, Utilization, Transportation and Storage
- System Integration and Optimization

CISERA will continue to advance technologies that will support our members GHG reduction initiatives today and into the future. We look forward further exploring these new technical challenges and developing new partnerships as we transform our program. It is important to include other industries facing similar technical challenges and GHG reduction goals. Co-operation is key and CISERA will be active in including these partners.

Finally, it is important that we continue sharing our research findings with colleagues and industry across the globe. CISERA has again published its work in several international journals and will continue to present papers at both domestic and international conferences.

Globally, CISERA is autonomous in its ability to continue to expand and meet its members' requirements. The remarkable co-operative relationships between the coal industry, steel industry and government are truly unique, and the CISERA R&D technical program will strive to address and reflect its members needs for years to come.

*Jason Halko*

Jason Halko,  
Chair, Board of Directors

## TECHNICAL COMMITTEE REPORT

### TECHNICAL COMMITTEE MEETINGS

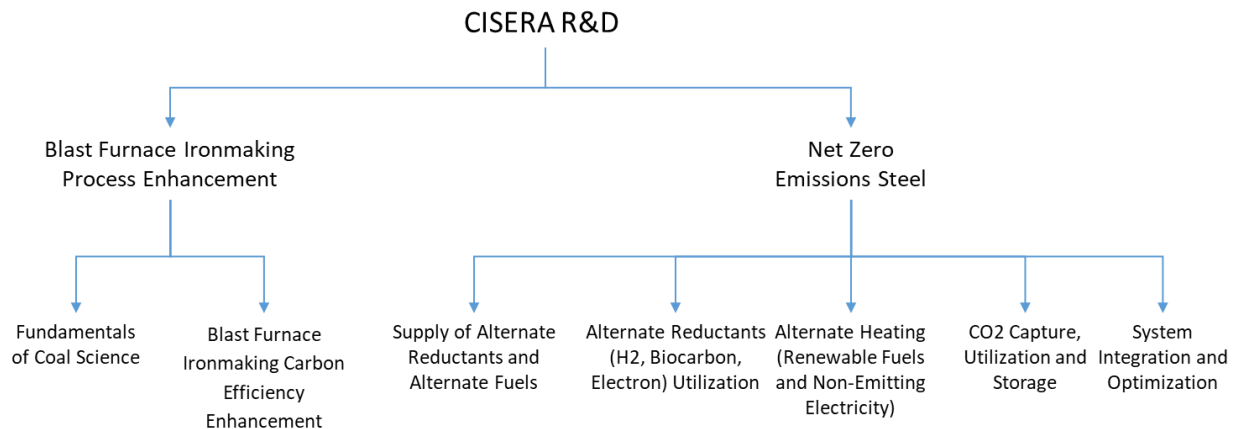

The CISERA Technical Committee held four meetings during Fiscal Year 2024-2025:

Meeting No.	Location	Date
267	CanmetENERGY Ottawa	June 4-5, 2024
268	CanmetENERGY Ottawa	October 2-4, 2024
269	CanmetMATERIALS Hamilton	December 10-11, 2024
270	CanmetENERGY Ottawa	March 11-12, 2025

### CISERA Research Program Update

One of the keys for CISERA success is its ability to manage the change in industry priorities. With the announcement of CSPA in achieving net-zero CO<sub>2</sub> emissions by 2050, the priority of the steelmaking members is decarbonization of their production processes. It was also recognized that support for the coal industry and BF/BOF steel producing members will continue as coke will be essential for decades to come. Hence, the CISERA program is updated to meet the current challenges. The Net Zero Emission Process Development program was added to the existing Blast Furnace Process Enhancement program. The new CISERA program consists of the following:

- **Blast furnace process enhancement**
  - Fundamentals of coal science
  - Blast furnace ironmaking process carbon efficient enhancement
- **Net Zero Emission Process Development**
  - Supply of Alternate Reductants and Alternative Fuels
  - Utilization of Alternative Reductants (Biocarbon, H<sub>2</sub>, Electrons)
  - Utilization of Alternate Heating (Renewable Fuels and Non-Emitting Electricity)
  - CO<sub>2</sub> Capture, Utilization, Transportation and Storage
  - System Integration and Optimization

The table below shows the status of projects in the **Blast Furnace Process Enhancement** Program

Sub Program	Project	Status
Fundamental of Coal Science	CISERA 54: ISO and ASTM Coal and Coke Standards	Active
	CISERA 80: Characterization of Coal Washing Plant Streams and Product Quality Upgrade	Not Active
	CISERA 81: Mineral Matters in Western Canadian Coal	On Hold
	CISERA 86: Performance of Canadian Coals in High Inert Blends	Completed
	CISERA 87: Technical Merits of Western Canadian Coals	Completed
	CISERA 90: Exploration Sample Assessment for Current and New Coal Mines in Canada	Active
	CISERA 93: Performance of Western Canadian Coal in Stamp Charge	Active
	CISERA 94: New Project Development: Semifusinite	Active
Blast Furnace Ironmaking Process Carbon Efficiency Enhancement	CISERA 82: Factors Affecting Coke Bed Permeability	Completed
	CISERA 84: Coke Degradation Mechanisms	Active
	CISERA 88: Application of Small-Scale Coking	On Hold
	CISERA 91: Blast Furnace Energy Reduction Initiatives using Auxiliary Fuel Injection	Completed

#### Publications:

During FY 2024-25, CISERA published 6 papers.

- Relationship between coking properties measured by automatic Sapozhnikov plastometer with other measurements, International Journal of Coal Preparation and Utilization, <https://doi.org/10.1080/19392699.2024.2402438>
- Evaluation of Biochar and Coke Blends for Slag foaming applications in EAF Steelmaking, Steel Research International; <https://doi.org/10.1002/srin.20240051>
- Solid carbonaceous materials transformation during pulverized coal and natural gas co-injection, Ironmaking & Steelmaking, <https://doi.org/10.1177/03019233241259298>
- Effect of Biocarbon Incorporation in Cokemaking and Resultant Coke Properties, International Conference on Sustainable Cokemaking and Ironmaking (ICSCI 2025), 16-19 March 2025 - Newcastle, Australia
- Interaction between Biogenic Carbon and Electric Arc Furnace Slag, International Conference on Sustainable Cokemaking and Ironmaking (ICSCI 2025), 16-19 March 2025 - Newcastle, Australia
- An Experimental Setup and Investigation on Biochar Blends for Slag Foaming Applications, 13th European Electric Steelmaking Conference, 3-7 June 2024, Philharmonie Essen, Germany

## 1. Fundamentals of Coal Science

### CISERA 54: ISO and ASTM Coal and Coke Standards

The effect of sample particle size on rheological properties (Gieseler plasticity and Ruhr dilatation) measurement results was studied in detail. Samples examined included Western Canadian coal, Appalachian coal and coal blends containing both Canadian and US coals. The results showed that the sample particle size significantly affects the measured values of maximum fluidity and dilatation. However, the melting range and T3-T1 were found relatively insensitive to variation in sample particle size. Experimental efforts highlighted the importance of sample preparation on rheological properties measurement consistency. To further elaborate, rheological properties on purposely over-crushed samples were conducted to illustrate the importance of sample preparation. Furthermore, sample particle size distribution in ISO standards related to plasticity and dilatation measurements were reviewed. It was proposed to specify test sample particle size distribution to eliminate effect of sample preparation on ASTM rheological properties measurement. Experimental measurement results will be published and will be shared with ASTM D05 for refinement of ASTM rheological properties measurement procedures.

### CISERA 81: Mineral Matters in Western Canadian Coal

The project was put on hold due to lack of expertise and equipment for mineral matters characterization in coal and coke.

### CISERA 87: Technical Merits of Western Canadian Coals

The works on western Canadian and US Appalachian coal were completed. The intent was to obtain Australian coal samples to complete the study. Multiple attempts were made for exploring the possibility in obtaining Australian coal without success. The project was put on-hold as inactive project until the challenges in Australian coal sample acquisition was resolved.

### CISERA 90: Exploration Sample Assessment for Current and New Coal Mines in Canada

This project consists of two parts:

- A. Development of water base Roben Jig washing technology for preparation of clean coal composite sample for properties assessment.
- B. Identification of alternate liquid for coal washability study to replace hazardous organic liquid.

Part A was completed and the usefulness of Roben Jig for preparation of clean coal composite for properties assessment and carbonization test were successfully demonstrated. However, it was observed that the data generated from Roben Jig washing is insufficient for washing plant design. Therefore, float/sink washability study using organic liquid is still necessary. Due to the hazardous nature of organic liquid commonly used in float/sink washability study, it is desired to identify an alternate liquid to improve health and safety of the task.

Product of Halocarbon was identified as potential candidate for replacement of organic liquid for coal washability study. Halocarbon sample was received from the manufacturer and experimental works were conducted to evaluate its performance in float/sink washability study. Clean coal composite samples were prepared by washing with the conventional organic liquid and the alternate liquid. Sole-heat oven carbonization tests were conducted for evaluation of the effect of washing liquid on resultant coke quality.

Besides coke quality, the texture analysis of the resultant cokes was conducted to compare the effect of washing liquid on detail coke characteristics.

#### CISERA 94: Semifusinite

Based on the preliminary exploration works conducted, the goal of this project was developed:

- To determine the mechanism of transformation of both partially and completely fusible semifusinite in WCC coals in comparison to Appalachian coals.
- To understand the role of measured rheological and petrographic properties of semifusinite transformation during coking.
- To determine the binder and filler phases that semifusinite transforms into from partial and complete fusible macerals.

A comprehensive literature review was conducted, and 2 immediate tasks were identified to initiate the research activities.

- Task 1: Analysis Techniques Development.
- Task 2: Macerals Chemical Composition/Structure Characteristics and Behavior Observation.

The goal of the above tasks is to identify equipment suitable for observing and characterizing macerals behaviors during coal to coke transformation. The usefulness of numerous analytical equipment in different universities and research institutions was explored. It was concluded that capability in direct microscopic observation of maceral transformation is essential. Hence, CISERA was committed to purchase a hot stage to be installed in Metallurgical Fuels Lab microscopic laboratory for enabling direct observation of maceral transformation. The equipment procurement is undergoing.

In parallel with the above efforts, TGA analysis of the devolatilization behavior of coal during coking was conducted. It was observed that majority of volatile matters released occurred at above Gieseler re-solidification temperature. Since the release of volatile matters is an outcome of macerals transformation, the observation suggested that majority of macerals transformation occurred during semi-coke to coke transformation. Further experimental works will be conducted by carbonizing coal to different stages of coking for detail examination of macerals transformation.

## **2. Research Program: Blast Furnace Ironmaking Process Carbon Efficiency Enhancement**

#### CISERA 84: Coke Degradation Mechanisms

The tensiometer was successfully set up and commissioned in Metallurgical Fuel Lab. The equipment enables direct observation of the sample upon heating. Using the tensiometer, the expansion and contraction behavior of coal samples during heating was examined. The behaviors of US-HV, US-LV, WCC and 2 coal blends were studied and compared. The coal samples were compacted into a cylindrical pellet (D: 6 mm; H: 3mm) and heated in inert gas atmosphere. The changes in volume during experiments were measured by image analysis. The experiments revealed the difference in expansion followed by contraction behaviors between samples. Coupling with the TGA analysis results, the evolution of sample density during coking can be calculated. Further experimental work will be conducted to study contraction behavior and its relationship with fissuration and resultant coke quality.

CISERA 88: Application of Small-Scale Coking

No activity was conducted in FY 2024-25.

CISERA 93: Performance of Western Canadian Coal in Stamp Charge

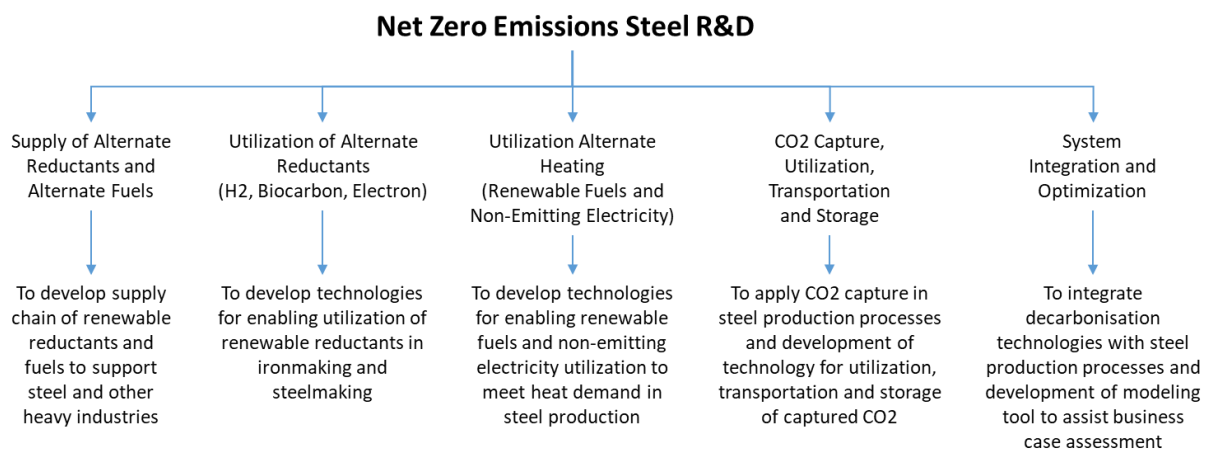

One of the barriers preventing progress of this project is the capability in densifying coal to the desired >1000kg/m<sup>3</sup> dry bulk density for conducting carbonization test using the 350 kg capacity pilot scale oven in Canmet. With the available of TSR 90 kg coke oven, this barrier can be relatively easier to overcome. In preparation of further test work, the previous stamp charge work conducted at TSR and Canmet were revealed. It was clearly shown that the increase in bulk density increases ASG of resultant coke, hence coke quality increases. Despite the challenges in materials handling is relatively smaller using the TSR oven, there are still operating issues to be overcome in conducting experimental work at high bulk density.

The effect of WCC incorporation on coal blend stampability was studied. The methodology for studying soil compaction was adopted for quantifying coal blend stampability. Coal blend samples with and without WCC is compacted with same energy input. The compacted coal bed density and compressive strength were measured and compacted. It was observed that incorporating WCC enhanced the stampability of the coal blend. In other words, high bulk density and coal bed with high strength were obtained with the same compacting energy input.

### 3. Research Program: Net Zero Process Development

#### **Steel Decarbonization R&D Pillars**

Decarbonization of steel production requires a combination of different technologies and requires expertise from different fields. To coordinate various efforts, the 5 pillars of R&D activities have been established. The purpose of this effort is for grouping of expertise for coordination of effort to accelerate decarbonization technologies development.

Leads of each pillar were appointed as follows:

- Alternate reductants/fuels supply: Peter Gogolek
- Alternate reductants utilization: Ka Wing Ng
- CCUS: Nicole Bond
- System integration and optimization: Milad Aghabararnejad

The leads have developed a 1-pager summary of scope of research activities in each pillar. The research activity scopes were presented in TC 267 and shared with CSPA for dissemination via CSPA and CISERA websites.

The progress in research activities was disseminated to industrial partners via TC meetings. A total of 26 presentations were discussed in TC meetings. The discussions covered a wide spectrum of research activities including biocarbon standards development, activities to address technical challenges of utilization of biocarbon, application of CCUS etc. The efforts informed industrial partners on the latest technologies development to achieve the goal of decarbonization.

An important outcome of the efforts was promoting collaboration between research groups in Canmet. As an example, 4 research groups were engaged to address the technical challenges in biocarbon utilization for slag foaming in EAF steelmaking. It successfully demonstrated collaboration was essential in advancement of technology and significant progress was achieved.

The collaborative efforts were further extended to engage academic researchers. Researchers from 3 universities, U of T, McMaster U, UQAC were invited to discuss their efforts on industrial decarbonization. The goal is to enhance awareness of research activities between researchers. Through these efforts, CISERA Technical Committee meetings are established as a platform for sharing information and avoid duplication to acceleration decarbonization technologies development.

#### 4. CanmetENERGY Met Fuels Lab Facilities

##### Annual MWO Benchmarking

Annual benchmarking of the Canmet MWOs is conducted to ensure the reliability of the equipment. No issues were seen in the results.

##### CanmetENERGY-Ottawa Met Fuels Facilities Utilization:

**Table 1 - Utilization of CanmetENERGY Facilities

**OTHER BUSINESS****1. CISERA Technical Roadmap**

- a. The roadmap was reviewed and aligned with the Technical Committee planning table. The research activities/streams have been reorganized and updated to better reflect current project work.
- b. The CISERA BOD is responsible for updating and planning the roadmap for the Technical Committee.
- c. The roadmap was continually updated to address the R&D needs for achieving the steel industry goal of net zero emission in 2050 while continue to provide support on coal and coke research.

**2. CISERA Research Program**

- a. Progress in all CISERA projects now being tracked with A3 plans and planning table.

**3. CanmetENERGY Met Fuels Activities**

- a. Revenues for 2024-25, \$2.8M

**4. CanmetENERGY Met Fuels Facilities Upgrade:**

- a. The set up of a new facility for iron ore pellet reduction in DRI process conditions is undergoing for research in steel decarbonization.

**5. CISERA Documents Management**

All CISERA documents are stored in Google drive to allow easy access by all members. A link was provided in the CISERA website members only area to access all documents.

<https://www.cisera.ca/members/>

Documents include:

- i. Technical committee meeting minutes
- ii. Board of Director meeting minutes
- iii. Annual reports
- iv. A3 plans
- v. Publications
- vi. Technical projects progress reports

**6. CISERA website**

The CISERA website <https://www.cisera.ca> was completely redesigned and fully implemented. The website is managed and maintained by Fullview Design, a website development company in Ottawa.

Roben Jig tube filled with coal and water and ready to be jiggled.

Technicians getting ready to invert the jig tube holding jiggled coal.

The first slice of coal is ready to be removed from the cylinder. It has been pushed up from the bottom and will be scraped off into a weighing container for Apparent Relative Density test.

## FINANCIAL YEAR IN REVIEW

The following provides an overview of the financial performance of the Canadian Iron & Steel Energy Research Association (CISERA) during the 2024–2025 fiscal year, as well as key trends over the past decade. The summary highlights revenue, expenses, and the overall financial health of the organization.

CISERA concluded the 2024–2025 fiscal year with an operating surplus of **\$54,456**, an increase from the **\$40,491** surplus reported in the prior year. This growth was primarily driven by higher interest income, resulting from larger temporary cash balances associated with an exceptional level of confidential research and development testing and a reduction in administrative costs. Membership levels remained steady at five members, with no changes in research levies or membership fees. However, membership is projected to decline by two members in 2025–2026, largely due to economic challenges arising from the introduction of U.S. tariffs.

CISERA’s financial strategy is designed to generate modest annual operating surpluses while channeling the maximum possible resources toward research initiatives, including ongoing support for CANMET.

This year, CISERA achieved a record volume of confidential research and development testing, totaling **\$2,795,713**—the highest level recorded since 2015–2016. This extraordinary activity was largely attributable to a one-time surge of testing from a single member in response to corporate reorganization.

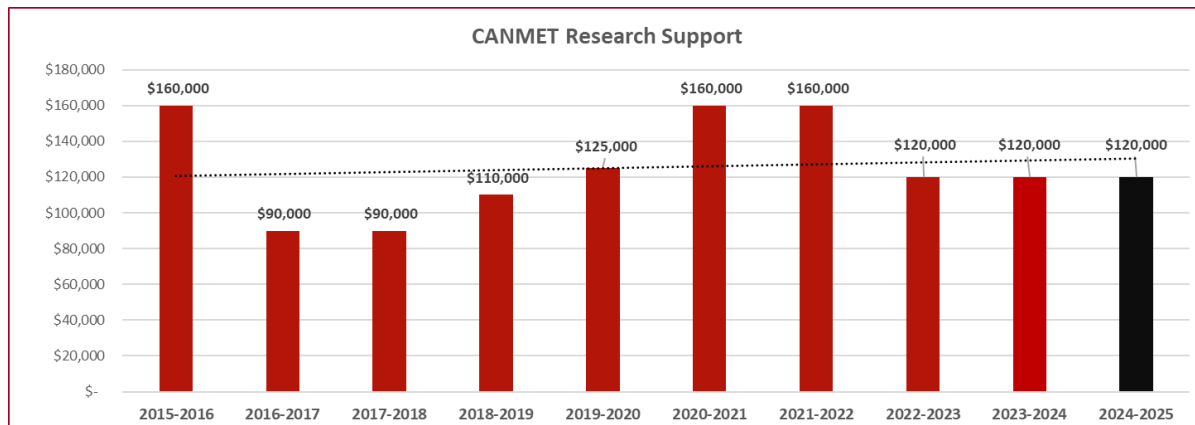

At year-end, Members’ Net Assets totaled **\$765,817**, representing a 7.7% increase over the previous year. Over the past decade, CISERA has intentionally managed its Members’ Net Assets to maintain financial stability during periods of reduced membership or economic downturns. This prudent approach has

enabled CISERA to sustain its operations and research mandate uninterrupted, even during challenging economic cycles. Entering the upcoming period of reduced membership, CISERA remains financially strong and well-positioned to continue its work.

Despite the decline in membership contributions attributable to membership levels, CISERA has maintained its commitment to research support, contributing **\$120,000** annually to the CANMET program for each of the last three fiscal years.

Administrative costs continue to be tightly managed. In 2024–2025, overhead expenses totaled **\$42,988**, reflecting a reduction of **\$2,362** (5.2%) from the prior year. This disciplined approach underscores CISERA's commitment to minimizing overhead in order to maximize funding available for research and development.

In summary, CISERA's strong financial performance in 2024–2025 has reinforced its stable financial position while ensuring the long-term sustainability of its research mandate in collaboration with CanmetENERGY.

## INDEPENDENT AUDITOR'S REPORT

---

To the Members of the  
Canadian Iron & Steel Energy Research Association

### *Opinion*

We have audited the financial statements of the Canadian Iron & Steel Energy Research Association (the "Association"), which comprise the statement of financial position as at March 31, 2025, and the statements of operations and changes in members' net assets and cash flows for the year then ended, and notes to the financial statements, including a summary of significant accounting policies.

In our opinion, the financial statements present fairly, in all material respects, the financial position of Canadian Iron & Steel Energy Research Association as at March 31, 2025, and the results of its operations and its cash flows for the year then ended in accordance with Canadian accounting standards for not-for-profit organizations.

### *Basis for Opinion*

We conducted our audit in accordance with Canadian generally accepted auditing standards. Our responsibilities under those standards are further described in the *Auditor's Responsibilities for the Audit of the Financial Statements* section of our report. We are independent of the Association in accordance with the ethical requirements that are relevant to our audit of the financial statements in Canada, and we have fulfilled our other ethical responsibilities in accordance with these requirements. We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our opinion.

### *Responsibilities of Management and Those Charged with Governance for the Financial Statements*

Management is responsible for the preparation and fair presentation of these financial statements in accordance with Canadian accounting standards for not-for-profit organizations, and for such internal control as management determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

In preparing the financial statements, management is responsible for assessing the Association's ability to continue as a going concern, disclosing, as applicable, matters related to going concern and using the going concern basis of accounting unless management either intends to liquidate the Association or to cease operations, or has no realistic alternative but to do so.

Those charged with governance are responsible for overseeing the Association's financial reporting process.

*Auditor's Responsibilities for the Audit of the Financial Statements*

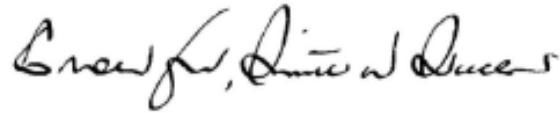

Our objectives are to obtain reasonable assurance about whether the financial statements as a whole are free from material misstatement, whether due to fraud or error, and to issue an auditor's report that includes our opinion. Reasonable assurance is a high level of assurance, but is not a guarantee that an audit conducted in accordance with Canadian generally accepted auditing standards will always detect a material misstatement when it exists. Misstatements can arise from fraud or error and are considered material if, individually or in the aggregate, they could reasonably be expected to influence the economic decisions of users taken on the basis of these financial statements.

As part of an audit in accordance with Canadian generally accepted auditing standards, we exercise professional judgment and maintain professional skepticism throughout the audit. We also:

- a) Identify and assess the risks of material misstatement of the financial statements, whether due to fraud or error, design and perform audit procedures responsive to those risks, and obtain audit evidence that is sufficient and appropriate to provide a basis for our opinion. The risk of not detecting a material misstatement resulting from fraud is higher than for one resulting from error, as fraud may involve collusion, forgery, intentional omissions, misrepresentations, or the override of internal control.
- b) Obtain an understanding of internal control relevant to the audit in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the Association's internal control.
- c) Evaluate the appropriateness of accounting policies used and the reasonableness of accounting estimates and related disclosures made by management.
- d) Conclude on the appropriateness of management's use of the going concern basis of accounting and, based on the audit evidence obtained, whether a material uncertainty exists related to events or conditions that may cast significant doubt on the Association's ability to continue as a going concern. If we conclude that a material uncertainty exists, we are required to draw attention in our auditor's report to the related disclosures in the financial statements or, if such disclosures are inadequate, to modify our opinion. Our conclusions are based on the audit evidence obtained up to the date of our auditor's report. However, future events or conditions may cause the Association to cease to continue as a going concern.
- e) Evaluate the overall presentation, structure and content of the financial statements, including the disclosures, and whether the financial statements represent the underlying transactions and events in a manner that achieves fair presentation.

We communicate with those charged with governance regarding, among other matters, the planned scope and timing of the audit and significant audit findings, including any significant deficiencies in internal control that we identify during our audit.

## CANADIAN IRON & STEEL ENERGY RESEARCH ASSOCIATION

### NOTES TO FINANCIAL STATEMENTS

for the year ended March 31, 2025

#### Organization

Canadian Iron & Steel Energy Research Association (formerly known as Canadian Carbonization Research Association) (the "Association") is a national organization with the purposes to conduct research and development having particular importance to the coal and carbonization industries of Canada; to coordinate and support Canadian carbonization research in and as it relates to steel, foundry, smelting and coal industries; to affiliate with national and international organizations or associations having similar objectives; and to affiliate with industries, academia and engineering of decarbonization and/or greenhouse gas emissions reduction strategies and solutions. The organization was incorporated under the Canada Corporations Act as a not-for-profit association in July 1981. In January 2014, the Association was issued a Certificate of Continuance under the Canada Not-for-Profit Corporations Act.

#### 1. Significant Accounting Policies

The financial statements of the Association are the representations of management prepared in accordance with Canadian accounting standards for not-for-profit organizations, consistently applied. Because a precise determination of many assets and liabilities is dependent upon future events, the preparation of periodic financial statements necessarily involves the use of estimates and approximations. These have been made using careful judgement in the light of available information. The financial statements have, in management's opinion, been properly prepared within reasonable limits of materiality and within the framework of the accounting policies summarized below:

##### Financial reporting framework

The Association, being a not-for-profit organization, chose to establish their financial statements in accordance with Canadian accounting standards for not-for-profit organizations, issued by the Chartered Professional Accountants of Canada.

##### Revenue recognition

Revenue from memberships is recognized over the membership term. Revenue related to memberships received in advance of the fee being earned or the service is performed is deferred and recognized when the fee is earned or service performed. Research levies are recognized in the fiscal year for which they have been assessed. Confidential research and development revenues are recognized when the related services are provided. Interest income is recognized in the period it is earned.

##### Financial instruments

The Association's financial instruments consisting of cash, short-term investments, accounts payable and accrued liabilities and due to CANMET are initially measured at fair value on acquisition and are subsequently measured at amortized cost. Transaction costs and financial fees associated with financial instruments carried at amortized cost are recorded as adjustments to the initial fair value recognized, and amortized over the life of the financial instrument.

## CANADIAN IRON & STEEL ENERGY RESEARCH ASSOCIATION

### NOTES TO FINANCIAL STATEMENTS

for the year ended March 31, 2025

#### 1. Significant Accounting Policies - continued

##### Foreign currency translation

These financial statements are presented in Canadian dollars. Assets and liabilities denominated in foreign currencies are translated at the exchange rates in effect at the statement of financial position date. Revenue and expenses are translated at rates of exchange prevailing on the transaction date. Gains and losses on translation are reflected in excess of revenue over expenses of the period.

#### 2. Short-term Investments

Short-term investments consist of three (2024 - three) guaranteed investment certificates bearing interest ranging between 2.20% and 3.70% (2024 - 4.75% and 4.95% ) and mature between January, 2025 and March, 2025 (2024 - December, 2024 and March, 2025). Certain of these certificates bear variable interest rates while some are fixed interest rates. They are subject to insignificant risk of change in value. The cost approximates the carrying value of short-term investments on the statement of financial position.

#### 3. Statement of Cash Flows

Changes in working capital components include:

	2025	2024
	\$	\$
Accounts receivable	(645,482)	
Prepaid expenses	(1,136)	1,080
Accounts payable and accrued liabilities	(10,012)	12,139
Government remittances payable	(6,574)	3,902
Due to CANMET	645,482	(60,000)
Deferred revenue	(55,200)	40,100
	<b>(72,922)</b>	<b>(2,779)</b>

#### 4. Financial Risks

Transactions in financial instruments expose the Association to certain financial risks and uncertainties. These risks include:

##### Interest rate risk

Interest rate risk is the risk that future cash flows of a financial instrument will fluctuate due to changes in market interest rates. The Association holds investments that earn income at varying rates of return which are dependent upon market conditions. Accordingly, the Association is exposed to the effects of fluctuations in market rates. Interest received in the year amounted to \$49,722 (2024 - \$38,341). As a result of an increase in short-term investments during the year, the Association's exposure to interest rate risk has increased over the prior year.

**CISERA**

## CISERA HISTORY

The Canadian Iron and Steel Energy Research Association (CISERA) was formed on September 2, 1965, with the adoption of a Constitution by the Canadian Steel and Coal industries, as a mechanism to promote and establish carbonization research in Canada. Representatives of the major cokemaking steel producers, an independent coke producer, major metallurgical coal miners, coal tar users and the Federal Government Department involved with these Industries were at the table.

The Association's original members were Algoma Steel Corporation, Canmore Mines Ltd, Crows Nest Industries, Dominion Foundries and Steel Limited, Dominion Tar & Chemicals Ltd, Dosco Steel Ltd, The Steel Company of Canada Ltd and The Mines Branch of Energy, Mines and Resources (EMR).

CISERA is a unique co-operative Research and Development effort between Industry and Government, which has become a model for many other industry/government R&D joint efforts. CISERA members and CANMET have a consensus-based program that has and continues to meet its members needs over many fruitful years.

Numerous members have also done and continue to perform many confidential test programs at CANMET to meet their needs directly.

Over the years, CISERA and CANMET have carried out many R&D programs to improve the metallurgical coal and cokemaking operations of its members. Many of these have had far reaching effects which have been well documented in studies carried out by consultants for the government showing the economic effects of the Joint R&D Program (NRCan Audit and Evaluation Branch report, 2001 and PricewaterhouseCoopers report, 2015). The benefits to Canadian industry have been substantial, however, it could not have taken place without the joint efforts of CANMET and CISERA. Having a laboratory to conduct carbonization research is beyond the feasibility of any one company so the single shared Canadian laboratory at Bells Corners in Ottawa, Ontario has allowed the continuation of R&D in this field in Canada.

The fields of R&D covered by the joint CISERA/CANMET program include energy and fuel conservation and efficiency, stabilization of supply, GHG reduction, mining, processing, transportation, production of iron, environment, and safety. At any specific time the R&D program places priority on the most pressing problems while not ignoring the longer term work necessary to progress in the future.

### The Early Years

The original members of CISERA and the senior officials of EMR were successful in convincing the Minister of EMR to establish a coal carbonization laboratory in Canada. The first Laboratory was located at The Mines Branch on Booth Street in Ottawa and centered around a 12-inch pilot coke oven and a newly designed sole heated oven. At first, the operation of the equipment was often performed by personnel from CISERA member companies and later CISERA employed personnel for this purpose. In 1968, with the help from CISERA members, a new laboratory facility location was chosen at Bells Corners, 20 km west of downtown Ottawa. EMR provided the building facilities and CISERA members supplied much of the carbonization equipment. A showpiece for the new facility was a new 18-inch movable wall pilot oven. A

---

*The Canadian Iron and Steel Energy Research Association (CISERA) was formed on September 2, 1965 - 60 years of Research supporting the Canadian Coal and Carbonization Industries*

30-pound coke oven was also part of the new facilities. In December 1968, the group at the Mines Branch responsible for coal and ironmaking were also relocated to Bells Corners.

### Expanding Activities in the 1970s

The coal preparation plant from Booth Street was moved to Clover Bar, just outside Edmonton, AB. Research work was managed by Mr. Jack C. Botham under the direction of the Technical Committee and centered on coal pipelining, additives to coking charges, hot briquetting, formed coke, and petrographic methods for all coals. Arrangements were made to establish a coking facility at Clover Bar to accommodate the Western Canadian Coal producers. Algoma arranged to donate their Koppers pilot coke oven. A mini fluidized bed was constructed for heating coal for hot briquetting as part of the formed coke project and by 1974, this facility was operational. EMR hired Drs. John Gransden and John Price who became the backbone of the Technical program and have gained international recognition as coal carbonization scientists.

In the early 1970s, a major focus for research was the fact that Western Canadian coal contains a significant amount of reactive semi-fusinite compared to traditional Appalachian coals from the USA.

During this period, R&D programs focused on petrographic analysis and coking tests helped place Western Canadian coal at the forefront of having excellent coking behaviour and producing excellent coke quality. CISERA has spent much effort explaining the benefits of these coals by using its research program to develop technical projects and has presented numerous papers supporting the technical merits of Western Canadian coals. This work is ongoing today as membership changes.

When the energy crisis developed in 1973-74 concern about energy self-sufficiency and sustainability became very important. This crisis resulted in several oil companies getting involved in the coal mining business. CISERA membership then included Shell Canada, Esso Resources, BP Canada and Gulf Canada.

When the energy crisis developed in 1973-74 concern about energy self-sufficiency and sustainability became very important. This

The organization underwent a substantial change in 1975 when the movable wall coke oven crew switched from being CISERA employees to EMR term employees, to conform with Government policy. CISERA established a new Treasurer system to handle the organization's financial affairs and research funding. This change resulted in the Treasurer's position becoming an appointed officer with full financial authority for the Association. At the time, Mr. George A. Chapman was appointed as Treasurer.

### Incorporation of CISERA & Facility Changes – the 1980s

CISERA was incorporated under The Canadian Corporations Act on July 16, 1981, as a non-for-profit Research Association. Letters patent set out the organizational structure with each member company putting forward a representative to the Board of Directors and a Technical Committee member.

The administration of CISERA is the responsibility of the Board of Directors to whom the Officers and other appointed positions report. The objectives of CISERA are set out in the Letters patent:

1. *To conduct Research and Development of importance to the coal and carbonization industries in Canada,*
2. *To co-ordinate and support Canadian carbonization Research in and related to steel, foundry, smelting and coal industries,*
3. *To affiliate with national and international organizations or associations having similar objectives, for the benefit of Canada.*

In the early 1980's, new research studies centered around the correlation of coke and processing conditions from the movable wall oven with that from industrial ovens. Gas and wall pressure measurements in pilot and industrial coke ovens were emphasized. This area of study included a unique study which took place at Algoma Steel's No. 6 coke battery, which was scheduled to be demolished. The study used the battery to carbonize very high-pressure coking blends to determine what the high coking wall pressures would do to an oven and if it could even cause wall failure.

One of the Technical highlights of CISERA at that time was the CISERA/NKK Technical Exchanges between Canada and Japan. Four Technical Exchanges took place, where both sides presented papers on their research work. The delegations generally involved 12 to 15 representatives from each country and was highly successful.

By the latter part of the 1980s, the international energy crisis had subsided, coal and steel prices were dropping, and both industries were entering a period of highly competitive markets. Coal injection into the blast furnace was introduced in Europe and Japan. In that period, many new projects were initiated by the CISERA Technical Committee. Among these were the upgrading of coking quality of Canadian coals through wash plant control, CSR and carbon texture, vertical temperature distribution in a coke oven, and the effect of partial aging/weathering of a component coal on coke quality.

A project to study blast furnace coal injection (PCI) was approved and a special facility was built at Bells Corners. CISERA and Canadian Steel Industries Research Association co-sponsored a study on Strategic Ironmaking with CANMET to review how technologies on ironmaking could evolve in the next 20 years. That study was completed in 1990 and became the road map for the steel industry for many years.

### Difficult Times in the Coal and Steel Industries – the 1990s

Canadian coal exports doubled over the 1980s. Research was aimed at reducing the cost of coke and energy for Canadian steelmakers and finding a global niche for Western Canadian coal. With Canadian coke batteries aging, PCI work became very important to coal and steel members. The PCI facilities at Bells Corners was proving its value in the injection program. A CISERA sponsored project at the University of British Columbia on coke oven modeling was completed and the model now resides at CANMET for all to use.

In 1995, CISERA celebrated its 30<sup>th</sup> anniversary. Because of difficult economic conditions in the Canadian coal and steel industries, membership had declined to eight members and EMR was undergoing a programme review. As a result, CISERA was asked to prepare an impact statement for their review.

History of Metallurgical Coal Production in Canada

By 1997, the CISERA/CANMET fee structure underwent a significant change with confidential oven test work increasing substantially. The Board of Directors approved By-law Number 2 to create a new category of Membership, the Connected Member. This was a category for members who were not financially eligible to join as full members but wished to be part of CISERA.

### Consolidation of the Coal Industry and the Challenges of the 2000s

The year 2000 saw another downturn in the steel and coal industries with two of the three Canadian steel members and one coal producer having to discontinue their CISERA memberships because of financial considerations. The reduction in members complicated CISERA's financial situation as the Association had to dip into its limited reserves to maintain its commitments to CANMET. The consolidation of the metallurgical coal producers at the end of 2002 further complicated the financial situation for CISERA as there was now only one coal and one steel member. The Association and CANMET co-operated to keep CISERA as a viable entity and hoped that new members could be attracted when the economy in these industries improved. Dr. Ross Leeder remained as Chair of the Board of Directors and Mr. Ted Todoschuk as Chair of the Technical Committee.

The number of metallurgical coal producers was substantially reduced in 2002 with the formation of Elk Valley Coal, which incorporated most of the producers under one organization. That left but only two members to carry the organization with CANMET. The history of important results on coal blend carbonization and the CANMET database that meet members needs made it an easy decision for the remaining ones to carry on.

The CISERA/CANMET R&D program has provided valuable technical information to the Canadian metallurgical coal industry that is accepted by their international customers as reliable, accurate and unbiased. This has allowed Canadian metallurgical coal to compete on the international market against foreign coals and retain jobs in Canada. The export of Canadian coal generates a significant amount of foreign exchange and assists with Canada's balance of payments. Today, Canada is one of the major exporting countries of metallurgical coal globally.

As CISERA celebrated its 40<sup>th</sup> Anniversary in 2005, the future looked more promising than it had in the last few years, despite the economic ups and downs of the industries represented by the CISERA. The continued CISERA/CANMET partnership benefited Canada as the participating industries gained new information because of the R&D program. International recognition was achieved for the R&D work performed through the CISERA/CANMET partnership.

*International recognition has been achieved for the R&D work performed through the CISERA/CANMET partnership*

At the end of 2006, Dr. Ross Leeder, the longest serving member of the Board retired from Elk Valley Coal Ltd. Ross had joined the Technical Committee in 1971 when he was a member of the CANMET staff at Bells Corners. He chaired the Technical Committee before moving to the Board of Directors. Ross became Chair of the BOD in 1989-90 and again in 1999-2006. During the 35 years of his association with CISERA, Ross presented numerous papers on the industry and on the technical merits of Western Canadian coals at Canadian and international conferences.

In 2007, two new coal companies joined as Connected Members, Anglo American Peace River Coal and Western Canadian Coal Corp. and Dr. Barry Ryan, B.C. government geologist, joined as an Individual Connected Member.

In 2008, George Chapman celebrated his 30<sup>th</sup> anniversary as Treasurer of the Association. Peace River Coal became a full member of the Association and Essar Steel Algoma Inc. joined as a Connected Member. That same year, after a career spanning 35 years, Dr. John Price took retirement from his position as Senior

Research Scientist and Manager of Energy for High Temperature Processes at CANMET.

In early 2009, Dr. John Grandsen, also Senior Research Scientist in coal carbonization, retired from CANMET. Dr. Grandsen received the AIST Joseph Becker Award for career accomplishments in cokemaking research for CISERA and CANMET. The departure of Drs. Price and Grandsen, both dedicated research scientists,

represented a significant loss to the CISERA within a very short time period. Furthermore, Dr. Barry Ryan retired from the B.C. Government Ministry of Energy, Mines and Petroleum Resources and, as there was no replacement named, the B.C. Government abandoned its membership.

For several years prior to 2008-09, the Greenhouse gas (GHG) file, as driven by the federal government, became a major thrust of the joint R&D program and the research program reflected that reality.

In 2009, the Technical Committee and the Board of Directors spent a significant amount of time and effort gathering information on the development and financing of a pilot Energy Recovery Pilot coke oven for

the joint CISERA/CANMET program to examine this alternative/new cokemaking technology. This endeavour is an excellent example of how CISERA adapts to the changes facing industry.

### **CISERA's 45<sup>th</sup> Anniversary - 2010**

The 45<sup>th</sup> anniversary of CISERA's foundation was celebrated in 2010. In 2010-2011, the Association started on a very ambitious project to carry out engineering, design, construction and commissioning of an Energy Recovery Pilot Coke Oven (ERCO) at Bells Corners coal and coke facilities. The ERCO technology is an alternate approach to traditional slot coke oven technology and the fact that pilot facilities using ERCO technology are essentially non-existent, R&D cannot be carried out. CISERA's goal for this project was to put Canada at the leading edge of this technology by having a facility where its members could be able to investigate how coal behaves in this type of oven and generate valuable data to allow the Canadian steel industry to evaluate this alternative technology. This facility would also be used to showcase the cokemaking merits of Western Canadian coals using this technology globally as well as making use of it to conduct research on the incorporating of in coal blends for assessing coke quality.

Due to the capital costs to finance such a large project, CISERA members contributed to a special fund. CISERA also signed a Non-Repayable Contribution Agreement with Natural Resources Canada to assist with the costs. The Canadian Steel Producers Association (CSPA) also contributed to the project. The goal was to secure the funding to enable the construction of the facility. In 2011-12, SunCoke Energy, USA was invited to join CISERA as a strategic partner in developing the energy recovery cokemaking programme as they have owned and operated commercial ovens using this technology for many years.

The 2011–2012 fiscal year saw a growth in CISERA members as US Steel Canada, SunCoke Energy, Inc. joined. Grande Cache Coal Corp., Alberta also rejoined the Association after being absent for some years.

During the 2013/2014 fiscal year, CISERA was obligated to transition from its original letters patent legal structure to comply with the requirements of the new Not-for-Profit Corporations Act. As of January 1, 2013, CISERA received its Certificate of Continuance as Corporation Number 117455-0 Industry Canada.

In 2014-2015, the CISERA with CanmetENERGY's cooperation, provided a website for the Canadian Iron and Steel Energy Research Association. The website is accessible at <https://www.cisera.ca> and contains timely information on the CISERA/CanmetENERGY R&D programs and other information related to the Canadian Coal and Coke industry as a whole.

The CISERA celebrated its 50<sup>th</sup> year milestone of providing research support to the Canadian Coal and Carbonization industries on September 2, 2015.

On September 30, 2016, Mr. George Chapman retired as Treasurer of CISERA. During his 40-year tenure in that function, Mr. Chapman provided important financial and administration stewardship of CISERA

and support to the Board of Directors and Members. The Board of Directors appointed Mr. Brian D'Amboise CPA, CA to succeed Mr. Chapman as Treasurer effective October 1, 2017. Mr. D'Amboise has over 25 years of involvement with CISERA as the former external auditor to the Association and provided Mr. Chapman valuable assistance in completing the 2016-17 fiscal year end and related tax returns.

CISERA pursued several outside research initiatives during the 2016-17 fiscal year. The Association continued work on the ISO Inter Laboratory Study on Coal Dilatation initiated in 2015-2016 and entered into a new research funding arrangement with Geoscience B.C. to support a study aimed at producing clean coal from Western Canadian Coal Fields using the water-based Roben Jig process. In addition, further studies on coal stamp charging and small-scale coking were developed to meet members future needs.

During 2017-18 fiscal year, the CISERA wrote four papers for presentation at AISTech 2017 in Nashville, USA and a report on Producing Clean Coal from Western Canadian Coalfields using the Water-Based Roben Jig Process in Geoscience BC Summary of Activities 2017. It made a presentation on this work at CoalSMART 2018 and organized two Working Group meetings on use of Biocarbon in Canadian Steel Industry (November 2017 and January 2018).

As well, the new PCI experimental rig at CanmetENERGY-Ottawa was upgraded to allow for better control of coal feeding rate and hot blast composition. A new approach was developed in processing the experimental data including the introduction of two new parameters to quantify the extent of gasification of coal Volatile Matter and Fixed Carbon and a new approach using TGA was developed to quantify the reactivity of combustion residues. Going forward, work will focus on enhancing the rig's capability in terms of NG/COG co-injection, blast gas moisture control and off-gas analysis.

On the use of renewable energy for the steel industry, research was pursued on several fronts including (1) Pyrolysis Technology Evaluation (2) Bio-Carbon for EAF Steelmaking (3) Bio-Briquette Formation (4) Bio-Carbon for Direct Injection in Blast Furnace Ironmaking (5) Biochar Production and Handling.

In 2018-19, the CISERA published three papers in peer-reviewed journals on (i) *"Value-In-Use of Renewable Biocarbon for Direct Injection in Blast Furnace Ironmaking"* in Ironmaking and Steelmaking journal (ii) *"Development of novel method for quantitative determination of carbon chemical reactivity"* in Canadian Journal of Chemical Engineering and (iii) *"Carbonaceous material properties and their interactions with slag during electric arc furnace steelmaking"* in Metallurgical and Materials Transactions B; it wrote papers for presentation at AISTech 2018 in Philadelphia, USA, for 8th International Conference on Science and Technology of Ironmaking in Vienna, Austria and a report on Producing Clean Coal from Western Canadian Coalfields using the Water-Based Roben Jig Process: Refining the Process in Geoscience BC Summary of Activities 2018. It made a presentation on this work at Western Canadian Coal Society in February 2019 and organized four Working Group meetings on use of Biocarbon in Canadian Steel Industry (April, June and November 2018 and March 2019).

Again in 2018-19, the CanmetENERGY Bioenergy group was a strong partner and made valuable contributions in assessing existing biomass conversion technologies, in the handling and cleaning and processing and carbonization. The Biocarbon for Iron and Steel production and other large emitters' project successfully secured S&T funding until March 2022.

In 2018-19, four meetings of the CISERA-Biocarbon for Steel Working Group were held at CanmetENERGY-Ottawa. These meetings were successful in advancing the discussion and interest level among the numerous project partners.

In 2021 the CISERA Biocarbon for Steel Working Group has seen the need for further guidance and involvement by other industries. This initiative will be led by CRIBE (Center for Research and Innovation in the Bioeconomy). The concepts remain, but the group will be called Biocarbon for Heavy Industry to include other industries similar to steel in the demand for bio energy. CISERA and its members will continue to be involved and are well engaged.

In 2023 the CSPA formally recognized CISERA as the technical branch for all their members. The goal of CISERA will be to establish communication channels and promote collaboration across the industry to work together to achieve the net-zero emission target by 2050.

Additionally, in honour of one of our esteemed colleagues, CISERA established the 'Louis Giroux Co-op Scholarship in Greenhouse Gas Reduction Science' with the University of Waterloo. This gift will provide students, faculty and researchers some of the resources that are required need to learn, explore and innovate while recognizing the contributions that Louis made to all of us both professionally and personally.

Finally, our very own CISERA Board Chair from 2007-2022 Ted Todoschuk received the distinguished AIST Joseph Becker Award for his contributions and achievements in coal and cokemaking research. The entire industry has benefited from Ted's logical and practical guidance throughout his illustrious career.

### **CISERA's key accomplishments through the years**

The CISERA and its members can be very proud of its accomplishments over the five decades since its inception. It is difficult to list all the accomplishments, but numerous papers and presentations have been made available to interested research organizations. Significant highlights include:

- The 2015 PricewaterhouseCoopers report showed the value of the research program and the significant positive financial impact of CISERA research on the Canadian GDP.
- Enhancing the understanding of the technical merits of Western Canadian coals in international markets leading to significant sales globally.
- Metallurgical coal resource development in Canada using CanmetENERGY-Ottawa pilot scale coal and coke facilities, equipment, and expertise.
- Development of unique coal and coke testing techniques to support CISERA member needs.
- Lower fuel rates and GHG reductions in the Canadian steel industry with coke quality improvements.
- Improved energy efficiency for Canadian Ironmakers with the use of pulverized coal injection.

- 
- Development of a biocarbon strategy to significantly reduce GHG emissions in the steel sector through multiple pathways.
  - Engagement with strategic biocarbon supply chain producers to initiate a bio economy with the steel sector.
  - Ensuring the development of suitable coal and coke quality standards to support the competitiveness of the Canadian coal and steel industries.
  - Engagement of CanmetENERGY's various researcher groups including CanmetENERGY-Ottawa Carbon Management Technology (CMT) Group, CanmetENERGY-Ottawa Industrial Innovation Group (IIG), CanmetMATERIALS and CanmetENERGY-Varennes Industrial System Optimization (ISO) which are associate with GHG reduction initiatives with the ultimate goal of supporting industrial receptors Recognized as the technical branch of the CSPA in 2023

### Going Forward

The uniqueness of the CISERA program is that it is able to adapt well to current and future needs of its members. The CISERA has recently embarked on R&D projects with international researchers in Australia, France, Japan, Sweden, USA and this has allowed the development of global partners and programs. In addition, CISERA is pursuing significant GHG reduction initiatives with both the coal and steel sectors as this is fast becoming a very significant global directive for these industries. In brief, CISERA is examining ways to achieve carbon-neutral ironmaking in the middle to long-term (2030-2040) by partnering with Canadian and International partners. These changes will ensure that the CISERA continues to meet the needs of industry and align with Government Policies. Much work is already underway and will continue to evolve.

**1965-2025 CHAIR OF BOARD OF DIRECTORS**

Year	Name	Company
1965 – 1966	C.W. Draker	Algoma Steel Limited
1967 – 1968	F.J. Pearce	The Steel Company of Canada Limited
1969 – 1970	J.E. Ludberg	Dominion Foundries and Steel Limited
1971 – 1972	J.S. Anslow	The Steel Company of Canada Limited
1973 – 1974	J.O. Thomas	DEVCO
1975 – 1976	A.M. Cameron	Algoma Steel Limited
1977 – 1978	J.T. Collier	DEVCO-SYSCO
1978 – 1979	W.A. Riva	Kaiser Resources Limited
1980 – 1981	J.E. Ludberg	Dofasco Limited
1981 – 1982	A. Johnson	Gulf Resources Limited
1983 – 1984	A.W. Kay	Stelco Inc.
1985 – 1986	R. Sagi	Denison Mines Limited
1987 – 1988	W. Becken	Dofasco Inc.
1989 – 1990	W.R. Leeder	Denison Mines Limited
1991 – 1992	K. Carnes	Fording Coal Limited
1993 – 1994	H. Stelmach	Line Creek Resources Limited
1995 – 1996	T. Benner	Dofasco Inc.
1997 – 1998	W. Jonasson	Algoma Inc.
1999 – 2000	W.R. Leeder	Teck Corporation
2001 – 2002	W.R. Leeder	TeckCominco Corp.
2003 – 2006	W.R. Leeder	Elk Valley Coal Limited
2007 – 2022	T. Todoschuk	ArcelorMittal Dofasco Inc.
2022 - 2025	J. Halko	<b>Elk Valley Resources Operations Limited</b>
